DETAILED ACTION

1. This Allowance is in response to the amendment filed on 1/20/2011.
 - a. Applicant's cancellation of claims 5, 9-13, and 16-20 is acknowledged by the office. Claims 1, 3-4, 6-7, and 14-15 are pending in the application. Claims 2 and 8 are previously canceled. Claims 6-7 and 14-15 are previously withdrawn as being drawn towards a non elected invention.
 - b. Claim 1 has been amended to include new limitations. Claims 3 and 4 have not been amended.

EXAMINER'S AMENDMENT

2. This application is in condition for allowance except for the presence of claims 6-7 and 14-15 directed towards a product non-elected without traverse. Accordingly, claim 6-7 and 14-15 have been cancelled.

Allowable Subject Matter

3. Claims 1 and 3-4 are allowed.

The following statement of reasons for the indication of allowable subject matter:

The prior art considered individually and in combination, fail to teach or suggest a method for producing high silicate glass comprising a phase separating step where borosilicate glass containing 0.1 wt% to 2.0 wt% of an oxide of any one element

manganese, cerium, chromium, cobalt, and copper is subjected to a heat treatment step, acid treatment step to elute a metal, and sintering step following the acid treatment step wherein the glass contains cerium or chromium and is subjected repeatedly (more than once) to another heat treatment and another acid treatment step using an acid containing EDTA following the first acid treatment step and prior to the sintering step.

The following references are considered the most relevant:

Nakagawa et al. (JP 57-188432) and (JP 57-205337) teaches a method for manufacturing high silicate glass where borosilicate glass is phase separated using acid and sintered to produce a high purity glass. Both references fail to teach or suggest the production of high silicate glass from borosilicate glass containing oxide concentrations of 0.1 to 2.0wt% of manganese, cerium, chromium, cobalt or copper. Nakagawa ('432) further fails to teach or suggest the acid treatment step being carried out using EDTA.

Corning Glass Works (US 3113855) teaches a process for producing high silicate glass where borosilicate glass is subjected to repeated heat and acid treatments. Corning fails to teach or suggest the oxides of manganese, cerium, chromium, cobalt or copper in concentrations of 0.1 to 2.0 wt% or the use of EDTA during the acid treatment step.

Marshall (US 4933307) teaches a method of making silica rich glass using borosilicate glass comprising various oxides including chromium in trace amounts of 0.1wt% (Example 1). Marshall teaches silica rich glass having silica concentrations up

to 80wt% which does not qualify as high silica glass as commonly defined in the art as containing 94% silica or greater (as referenced by Elmer (US 3113855 or Corning Glass Works (US 2303756). Thus Marshall fails to teach or suggest repeated acid and heat treatment steps as well as a method for the production of high silicate glass. Marshall further fails to teach or suggest the use of EDTA during the acid treatment step.

Boyd (US 4116704) also teaches the production of Pyrex glass (borosilicate glass) where various oxides are used as colorants. The taught glass contains CoO, and MnO in concentrations ranging from 0.5 to .21 wt%. Thus Boyd teaches borosilicate glass containing high concentrations of oxide impurities however Boyd fails to teach or suggest the use of this glass in the production of high silicate (containing at least 94% silica) glass. Boyd further fails to teach or suggest the application of EDTA during the acid leaching step.

The above reference considered individually, and in combination fail to teach the claimed limitations as stated in the above reasons for allowance.
